AUTHOR (S)
Brenda Paul

LESSON TITLE
Why is that fossil THERE?

GRADE LEVEL
6th-8th Grade

TIME FRAME
1-2 45-minute class periods

DRIVING QUESTION
How can fossils be found in environments different than where the organism lived?

LEARNING GOALS
● Make connections between fossil characteristics and environmental needs of the organism
● Make connections between geologic process and changes in an environment over time

ANCHORING EVENT
Show students this YouTube video about tree fossils that were discovered in Antarctica: Scientists Discover Ancient Tree Fossils in Antarctica. Then, discuss with students what Antarctica looks like using the Antarctica Photo Gallery and compare it to the places where you would normally find trees.

COLLABORATIONS
Students will work in groups to complete the station questions while analyzing the fossils, environments, and geologic processes.

Ideally, students should be grouped based on strength, with each group including:
- writing strength
- technology strength
- critical thinking strength

**STEM INTEGRATION**
- **Science**: Students will make connections between geologic process and changes in an environment over time.
- **Technology**: Students will use digital resources (google maps/google tour) to explore the fossil locations and research the geologic history of the area.
- **Engineering**: Students will make experience the benefits of utilizing 3D printed items.

**ASSESSMENT**
- Students will be assessed based on their answers to the questions at each station.

**PROCEDURE**

**Introduction**
Introduce the lesson using the “Anchoring Event“ activity:
- Show students this YouTube video about tree fossils that were discovered in Antarctica: [Scientists Discover Ancient Tree Fossils in Antarctica](#). Then, discuss with students what Antarctica looks like using the Antarctica Photo Gallery and compare it to the places where you would normally find trees.
- Distribute the worksheet that accompanies the stations. Verbally, answers the questions together using the information from the video. Focus on the **how** for the final question.

**Stations/Work Session**
Set up stations around the room. Each station should be equipped with:
- the printed slide for the station (make sure to print either the iPad or non-iPad version, depending on your device) Attached in resources below.
- the corresponding 3D printed fossil

Divide students into small groups of between 3 and 4 students (stations can be duplicated if necessary, for larger classes).

As a group, students should complete the Fossil Station Questions handout. *Note: the stations do not need to be completed in a particular order.*
- Station 1: Mt. Everest, Himalayan Mountain, Tibet/Nepal, Snail (gastropod, *Bellerophon randerstonensis*), 326-359 mya
- Station 2: Grand Canyon, Kaibab Plateau, Arizona, Horn Coral (*rugosa*), 250 mya
- Station 3: Mt. Charleston, Nevada, Shell (brachiopod, Spiriferid Brachiopod), 248 to 545 mya
- Station 4: Floyd County, Georgia, Trilobite (Elrathia antiquate), 500 mya

**Extension**
Students who complete the stations should select the location and fossil most interesting to them. Students should do additional research on the fossil they selected and create a presentation about the fossil.

**STANDARDS**

*Middle School*

**NEXT GENERATION SCIENCE STANDARDS (NGSS)**
MS-ESS2-3 Analyze and interpret data on the distribution of fossils and rocks, continental shapes, and seafloor structures to provide evidence of the past plate motions.

CCSS STANDARDS

CCSS.ELA-LITERACY.RI.5.7
Draw on information from multiple print or digital sources, demonstrating the ability to locate an answer to a question quickly or to solve a problem efficiently.

CCSS.ELA-LITERACY.RI.6.7
Integrate information presented in different media or formats (e.g., visually, quantitatively) as well as in words to develop a coherent understanding of a topic or issue.

CCSS.ELA-LITERACY.RI.7.10
By the end of the year, read and comprehend literary nonfiction in the grades 6-8 text complexity band proficiently, with scaffolding as needed at the high end of the range.

CCSS.ELA-LITERACY.RI.8.10
By the end of the year, read and comprehend literary nonfiction at the high end of the grades 6-8 text complexity band independently and proficiently.

OTHER STANDARDS

21st Century Skills

Use Systems Thinking
Analyze how parts of a whole interact with each other to produce overall outcomes in complex systems

**Fossil Station Questions Worksheet**

As you go through each station, answer the questions about each fossil and the location in which it was found. Use the google tour, the information provided at each tour location, and the research links to expand your information.

*Be sure to use scientific vocabulary in your explanations!* 

---

**Station 1**

Location: Mt. Everest, Himalayan Mountains, Tibet/Nepal  
Fossil: Snail (gastropod, *Bellerophon randerstonensis*)

1. Describe the environment in which the fossil was found.

2. Describe the environment you would expect to find the fossil in when it was a living organism?

3. Describe the geologic processes (including plate tectonics) that changed the organism’s environment to the current environment. Use the websites provided at the station for additional research.

---

**Station 2**

Location: Grand Canyon, Arizona  
Fossil: Horn coral (*rugosa*)

1. Describe the environment in which the fossil was found.

2. Describe the environment you would expect to find the fossil in when it was a living organism?

3. Describe the geologic processes (including plate tectonics) that changed the organism’s environment to the current environment. Use the websites provided at the station for additional research.
Station 3
Location: Mt. Charleston, Nevada
Fossil: Shell (brachiopod, *Spiriferid Brachiopod*)
1. Describe the environment in which the fossil was found.
________________________________________________________________________________________
2. Describe the environment you would expect to find the fossil in when it was a living organism?
________________________________________________________________________________________
3. Describe the geologic processes (including plate tectonics) that changed the organism’s environment to the current environment. Use the websites provided at the station for additional research.
________________________________________________________________________________________

Station 4
Location: Floyd County, Georgia
Fossil: Trilobite (*Elrathia antiquate*)
1. Describe the environment in which the fossil was found.
________________________________________________________________________________________
2. Describe the environment you would expect to find the fossil in when it was a living organism?
________________________________________________________________________________________
3. Describe the geologic processes (including plate tectonics) that changed the organism’s environment to the current environment. Use the websites provided at the station for additional research.

KEY ACADEMIC AND/OR SCIENTIFIC LANGUAGE

- **Pangaea** - ("all land") the single huge supercontinent that existed 245 million years ago, when all of Earth's continents were joined together.
- **seafloor spreading** - the process by which new oceanic crust forms when magma rises up and solidifies at the mid-ocean ridges. The newer crust pushes the older crust out to each side, which is why the age of the sea floor increases with distance away from the mid-ocean ridges.
- **subduction** - the process by which one tectonic plate sinks below another, returning to the mantle, where the rock is re-melted. Subduction takes place at convergent plate boundaries. Oceanic crust, which is denser, will always subduct under the less dense continental crust.
- **tectonic plates** - large pieces of the lithosphere that slowly move on top of the asthenosphere. There are seven primary plates and many smaller ones. The seven primary plates are the African Plate, Antarctic Plate, Eurasian Plate, Indo-Australian Plate, North American Plate, Pacific Plate, and South American Plate.
- **convergent plate boundaries** - where two tectonic plates move toward each other
- **divergent plate boundaries** - where two tectonic plates move away from each other
- **transform plate boundary** - where two tectonic plates slip past each other, moving in opposite directions
- **fossil** - mineralized or otherwise preserved remains or traces (such as footprints) or impressions of animals, plants, and other organisms
- **convection currents** - movement within hot fluids, when the heat source is on the bottom, such as in a boiling pot of soup on the stove. Convection currents happen because the hotter material is less dense and rises; when it reaches the surface, it cools and becomes less dense, so it sinks. This rising and sinking creates a circular motion within the fluid.
- **tectonic plate boundary** - a place where two tectonic plates meet
- **fault** – occurs where once continuous section of rock has been displaced due to tectonic activity or massive rock movement.
- **uplift** – elevating the Earth’s crust vertically due to tectonic activity. Usually associated with mountain building events and produce earthquakes.

PRIOR KNOWLEDGE

Students should have an understanding of the theory of plate tectonics, including types of plate boundaries and convection currents.
